

Styles  
React Native

# Style

- React Native style application using JavaScript
- core components accept a prop named **style**
- style names and values usually match how CSS works on the web, except names are written using camel casing,
  - e.g. **backgroundColor** rather than **background-color**
- style prop can be a plain old JavaScript object OR an Array
  - the last style in the array has precedence

# Style Properties

- Border
- Margin
- Padding
- Text

# Style Encapsulation

- React Native does not support Style Inheritance.
